Fabian Kuhn

# Matching

**Matching:** Set of pairwise non-incident edges

**Maximal Matching:** A matching s.t. no more edges can be added

**Maximum Matching:** A matching of maximum possible size

**Perfect Matching:** Matching of size  $n/2$  (every node is matched)

# Bipartite Graph

**Definition:** A graph  $G = (V, E)$  is called bipartite iff its node set can be partitioned into two parts  $V = V_1 \cup V_2$  such that for each edge  $\{u, v\} \in E$ ,

$$|\{u, v\} \cap V_1| = 1.$$

- Thus, edges are only between the two parts

# Hall's Marriage Theorem

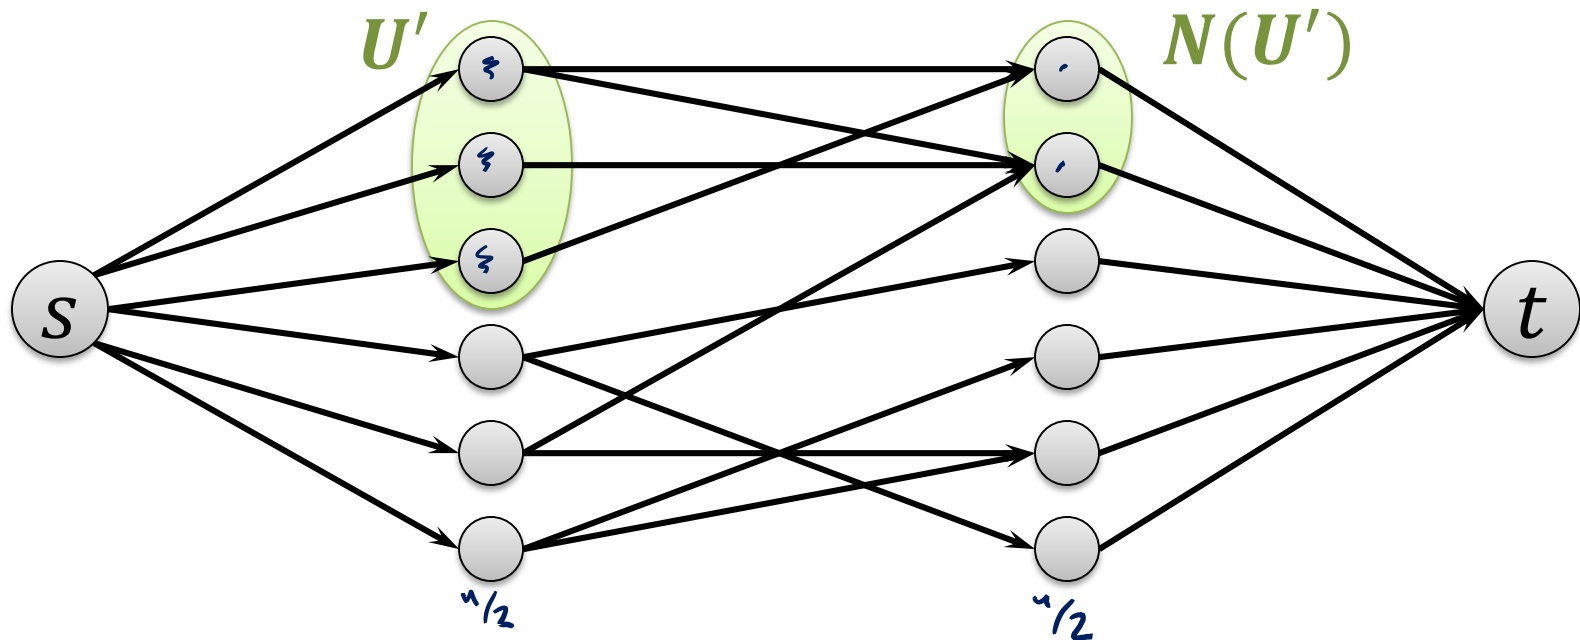

**Theorem:** A bipartite graph  $G = (U \cup V, E)$  for which  $|U| = |V|$  has a perfect matching if and only if

$$\forall U' \subseteq U: |N(U')| \geq |U'|,$$

where  $N(U') \subseteq V$  is the set of neighbors of nodes in  $U'$ .

**Proof:** No perfect matching  $\Leftrightarrow$  some  $s$ - $t$  cut has capacity  $< n/2$

1. Assume there is  $U'$  for which  $|N(U')| < |U'|$ :

# What About General Graphs

- Can we efficiently compute a maximum matching if  $G$  is not bipartite?
- How good is a maximal matching?
  - A matching that cannot be extended...
- Vertex Cover: set  $S \subseteq V$  of nodes such that
 
$$\forall \{u, v\} \in E, \quad \{u, v\} \cap S \neq \emptyset.$$

- A vertex cover covers all edges by incident nodes

# Vertex Cover vs Matching

Consider a matching  $M$  and a vertex cover  $S$

**Claim:**  $|M| \leq |S|$

**Proof:**

- At least one node of every edge  $\{u, v\} \in M$  is in  $S$
- Needs to be a different node for different edges from  $M$

# Vertex Cover vs Matching

Consider a matching  $M$  and a vertex cover  $S$

**Claim:** If  $M$  is maximal and  $S$  is minimum,  $|S| \leq 2|M|$

**Proof:**

- $M$  is maximal: for every edge  $\{u, v\} \in E$ , either  $u$  or  $v$  (or both) are matched

- Every edge  $e \in E$  is “covered” by at least one matching edge
- Thus, the set of the nodes of all matching edges gives a vertex cover  $S$  of size  $|S| = 2|M|$ .

# Maximal Matching Approximation

**Theorem:** For any maximal matching  $M$  and any maximum matching  $M^*$ , it holds that

$$\underline{|M| \geq \frac{|M^*|}{2}}.$$

**Proof:**

$S^*$ : opt. vertex cover

$$|M^*| \leq |S^*| \leq 2|M|$$

**Theorem:** The set of all matched nodes of a maximal matching  $M$  is a vertex cover of size at most twice the size of a min. vertex cover.

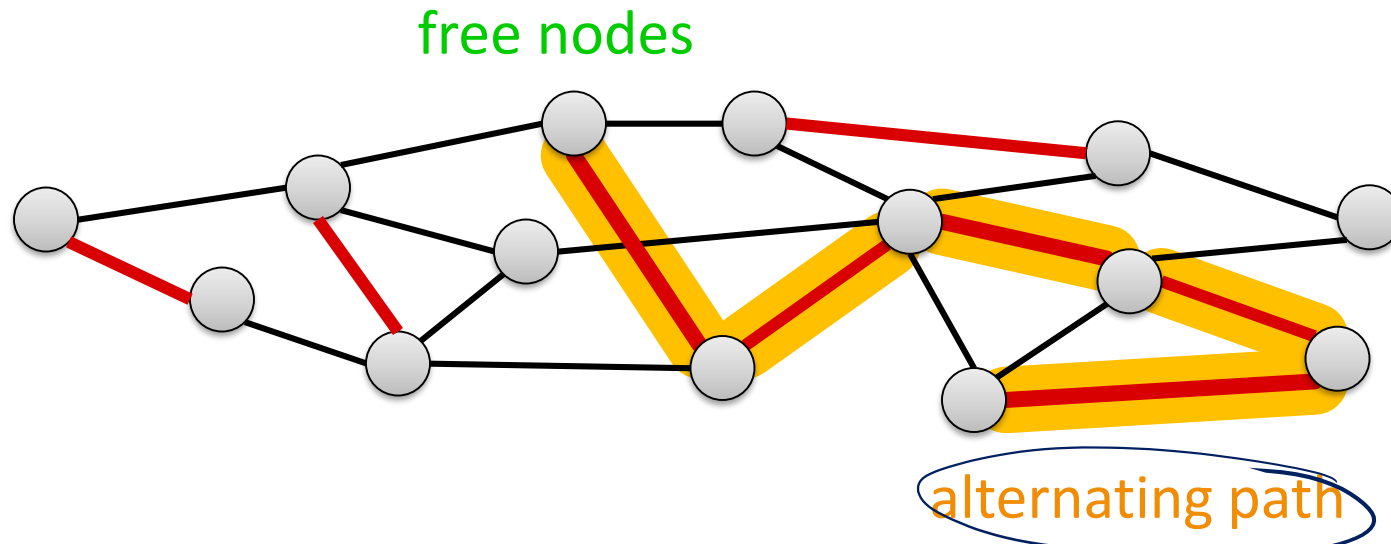

# Augmenting Paths

Consider a matching  $M$  of a graph  $G = (V, E)$ :

- A **node**  $v \in V$  is called **free** iff it is **not matched**

**Augmenting Path:** A (odd-length) path that starts and ends at a free node and visits edges in  $E \setminus M$  and edges in  $M$  alternately.

- Matching  $M$  can be improved using an augmenting path by switching the role of each edge along the path

# Augmenting Paths

**Theorem:** A matching  $M$  of  $G = (V, E)$  is maximum if and only if there is no augmenting path.

**Proof:**

- Consider non-max. matching  $\underline{M}$  and max. matching  $\underline{M}^*$  and define

$$\underline{F} := \underline{M} \setminus \underline{M}^*, \quad \underline{F}^* := \underline{M}^* \setminus \underline{M}$$

- Note that  $\underline{F} \cap \underline{F}^* = \emptyset$  and  $\underline{|F|} < \underline{|F^*|}$
- Each node  $v \in V$  is incident to at most one edge in both  $\underline{F}$  and  $\underline{F}^*$
- $\underline{F} \cup \underline{F}^*$  induces even cycles and paths

# Finding Augmenting Paths

# Blossoms

- If we find an odd cycle...

# Contracting Blossoms

**Lemma:** Graph  $G$  has an augmenting path w.r.t. matching  $M$  iff  $G'$  has an augmenting path w.r.t. matching  $M'$

**Note:** If stem has length 0, root  $v$  of blossom is free and thus also the node  $v'$  is free in  $G'$ .

**Also:** The matching  $M$  can be computed efficiently from  $M'$ .

# Edmond's Blossom Algorithm

## Algorithm Sketch:

1. Build a tree for each free node
2. Starting from an explored node  $u$  at even distance from a free node  $f$  in the tree of  $f$ , explore some unexplored edge  $\{u, v\}$ :
  1. If  $v$  is an unexplored node,  $v$  is matched to some neighbor  $w$ :  
add  $w$  to the tree ( $w$  is now explored)
  2. If  $v$  is explored and in the same tree:  
at odd distance from root  $\rightarrow$  ignore and move on  
at even distance from root  $\rightarrow$  **blossom found**  $\rightarrow$  smaller graph
  3. If  $v$  is explored and in another tree  
at odd distance from root  $\rightarrow$  ignore and move on  
at even distance from root  $\rightarrow$  **augmenting path found**

# Running Time

**Finding a Blossom:** Repeat on smaller graph

**Finding an Augmenting Path:** Improve matching

**Theorem:** The algorithm can be implemented in time  $O(mn^2)$ .

graph exploration to find augm. path / blossom  
→ DFS traversal :  $O(m)$

can contract only  $O(n)$  blossoms until we find an augm. path  
at most  $\frac{n}{2}$  augm. paths

# Maximum Weight Bipartite Matching

- Let's again go back to bipartite graphs...

**Given:** Bipartite graph  $G = (U \dot{\cup} V, E)$  with edge weights  $c_e \geq 0$

**Goal:** Find a matching  $M$  of maximum total weight

# Minimum Weight Perfect Matching

**Claim:** Max weight bipartite matching is **equivalent** to finding a **minimum weight perfect matching** in a complete bipartite graph.

1. Turn into maximum weight perfect matching
  - add dummy nodes to get two equal-sized sides
  - add edges of weight 0 to make graph complete bipartite
2. Replace weights:  $c'_e := \max_f \{c_f\} - c_e$

# As an Integer Linear Program $u \text{ --- } v$

- We can formulate the problem as an integer linear program

Var.  $x_{uv}$  for every edge  $(u, v) \in U \times V$  to encode matching  $M$ :

$$x_{uv} = \begin{cases} \underline{1}, & \text{if } \{u, v\} \in M \\ \underline{0}, & \text{if } \{u, v\} \notin M \end{cases}$$

## Minimum Weight Perfect Matching

$$\min \sum_{u,v \in U \times V} c_{u,v} \cdot x_{u,v}$$

$$\forall u \in U: \sum_{v \in V} x_{u,v} = 1$$

$$\forall v \in V: \sum_{u \in U} x_{u,v} = 1$$

$$\forall u,v: x_{u,v} \in \{0, 1\}$$

# Linear Programming (LP) Relaxation

## Linear Program (LP)

- Continuous optimization problem on multiple variables with a linear objective function and a set of linear side constraints

## LP Relaxation of Minimum Weight Perfect Matching

- Weight  $c_{uv}$  & variable  $x_{uv}$  for every edge  $(u, v) \in U \times V$

$$\min \sum_{(u,v) \in U \times V} c_{uv} \cdot x_{uv}$$

s. t.

$$\forall u \in U: \sum_{v \in V} x_{uv} = 1,$$

$$\forall v \in V: \sum_{u \in U} x_{uv} = 1$$

$$\forall u \in U, \forall v \in V: \underline{x_{uv} \geq 0}$$

$$\underline{\underline{LP^*}} \leq \underline{\underline{ILP^*}}$$

# Dual Problem

- Every linear program has a dual linear program
  - The dual of a minimization problem is a maximization problem
  - Strong duality: primal LP and dual LP have the same objective value

In the case of the minimum weight perfect matching problem

- Assign a variable  $\underline{a_u \geq 0}$  to each **node**  $u \in U$   
and a variable  $\underline{b_v \geq 0}$  to each **node**  $v \in V$
- **Condition:** for every edge  $(u, v) \in U \times V$ :  $\underline{a_u + b_v \leq c_{uv}}$
- Given perfect matching  $\underline{M}$ :

$$\sum_{(u,v) \in \underline{M}} c_{uv} \geq \sum_{u \in U} \underline{a_u} + \sum_{v \in V} \underline{b_v}$$

# Dual Linear Program

- Variables  $\underline{a_u} \geq 0$  for  $u \in U$  and  $\underline{b_v} \geq 0$  for  $v \in V$

$$\underline{\max} \sum_{u \in U} a_u + \sum_{v \in V} b_v$$

s. t.

$$\underline{\forall u \in U, \forall v \in V: a_u + b_v \leq c_{uv}}$$

- For every perfect matching  $M$ :

$$\underline{\sum_{(u,v) \in M} c_{uv}} \geq \underline{\sum_{u \in U} a_u + \sum_{v \in V} b_v}$$

# Complementary Slackness

- A perfect matching  $M$  is optimal if

$$\sum_{(u,v) \in M} c_{uv} = \sum_{u \in U} a_u + \sum_{v \in V} b_v$$

- In that case, for every  $(u, v) \in M$

$$\underline{w_{uv}} := \underline{c_{uv}} - \underline{a_u} - \underline{b_v} = \underline{0}$$

- In this case,  $M$  is also an optimal solution to the LP relaxation of the problem
- Every optimal LP solution can be characterized by such a property, which is then generally referred to as complementary slackness
- **Goal:** Find a dual solution  $a_u, b_v$  and a perfect matching such that the complementary slackness condition is satisfied!
  - i.e., for every matching edge  $(u, v)$ , we want  $w_{uv} = 0$
  - We then know that the matching is optimal!

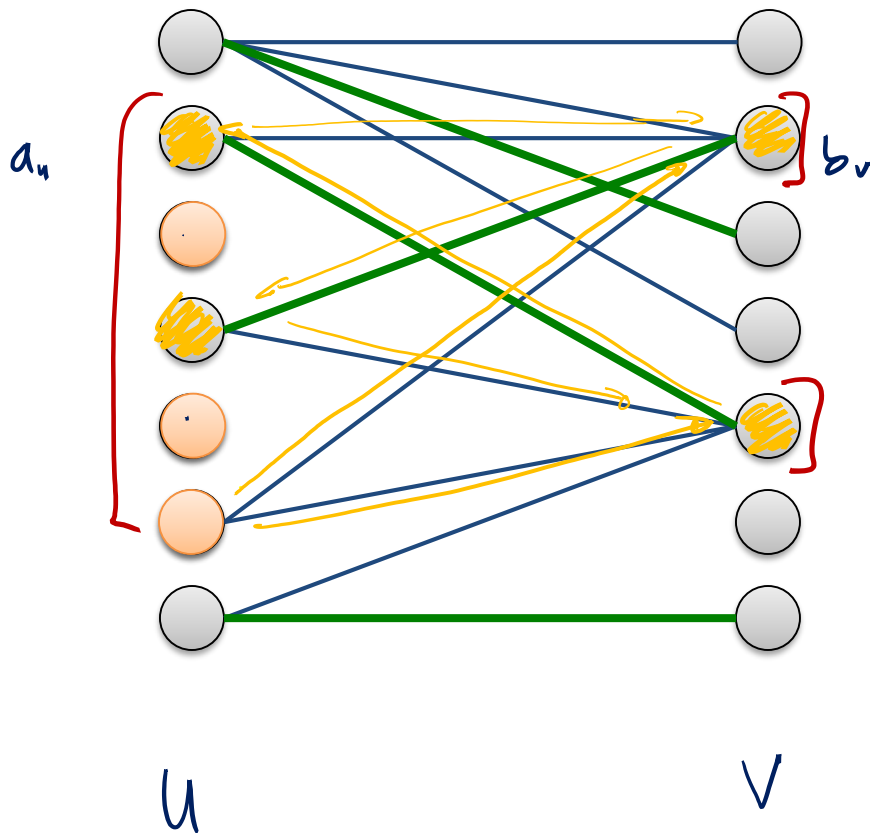

# Algorithm Overview

- Start with any feasible dual solution  $(a_u, b_v)$ 
  - i.e., solution satisfies that for all  $(u, v)$ :  $c_{uv} \geq a_u + b_v$
- Let  $E_0$  be the edges for which  $w_{uv} = 0$ 
  - Recall that  $w_{uv} = c_{uv} - a_u - b_v$
- Compute **maximum cardinality matching  $M$  of  $E_0$**
- All edges  $(u, v)$  of  $M$  satisfy  $w_{uv} = 0$ 
  - Complementary slackness if satisfied
  - If  $M$  is a perfect matching, we are done
- If  $M$  is **not a perfect matching, dual solution can be improved**

# Marked Nodes

## Define set of marked nodes $L$ :

- Set of nodes which can be reached on alternating paths on edges in  $\underline{E_0}$  starting from unmatched nodes in  $U$

edges  $\underline{E_0}$  with  $w_{uv} = 0$

optimal matching  $M$

$L_0$ : unmatched nodes in  $U$

$L$ : all nodes that can be reached on alternating paths starting from  $L_0$

# Marked Nodes

## Define set of marked nodes $L$ :

- Set of nodes which can be reached on alternating paths on edges in  $E_0$  starting from unmatched nodes in  $U$

edges  $E_0$  with  $w_{uv} = 0$

optimal matching  $M$

$L_0$ : unmatched nodes in  $U$

$L$ : all nodes that can be reached on alternating paths starting from  $L_0$
